

How to make a transportable pen

Making an electrified pen for overnight trekking where there is no paddock is quite easy. Find a plastic standard that you cut in half. Then see if you get some pipe that fits over the standard in the middle tightly, so that you can put the standard back together again.

Once you found a good fit, buy more standards and pipe. I found 8 standards is more than enough for my horse.

When you transport the standards, you put the pipe on the metal spike. This will keep the standard from poking out of your bag.

Get a small battery powered electric unit and some tape. Also take a bit of wire for the earth. Make a bag or wrap it all up in your travel rug and that is it. You made yourself a portable pen.
